

Technical Requirements: Online Booking System

The booking system should provide accurate real-time availability, support staff-specific services, simplify repeat bookings for registered clients, and securely store the client's profile and consultation form.

1. Staff Members and Service Assignment

The online booking system must include the following four staff members: **Ilona, Irena, Inna, and Vladislava**.

Each staff member must have an individual list of services/procedures they are qualified to perform.

Some procedures may be performed by more than one staff member. In this case, the same procedure must be assigned to every relevant specialist.

When a client selects a procedure, the booking system should display only the staff members who provide that specific procedure.

2. Automatic Blocking of Booked Time Slots

The booking system must operate using **real-time availability**.

Once a client books a specific time with a staff member, that time must immediately become unavailable to other clients.

The system must take the **full duration of the procedure** into account, not only its starting time.

Double bookings or overlapping appointments for the same staff member must be technically impossible.

***Example:** If a client books an Endospheres procedure with a specific staff member at 10:00, another client must not be able to book that staff member at 10:00 or select any other appointment that overlaps with the existing booking.*

3. Mandatory 15-Minute Buffer Between Appointments

An additional **15-minute internal buffer** must automatically be reserved after every procedure.

This time is required for room preparation, cleaning and preparation of equipment, and preparing the workspace for the next client.

The 15-minute buffer should **not be shown to the client as part of the procedure duration**, but it must be included when the system calculates the next available booking time.

Booking availability formula: procedure duration + 15-minute internal buffer.

***Example:** If a procedure starts at 10:00 and lasts 60 minutes, the client sees the procedure as running from 10:00 to 11:00. However, the next available appointment with that staff member must not start before 11:15.*

4. Fast Booking for Registered Clients

When a registered client logs into their personal account, the system should automatically use the personal information already saved in the client's profile.

Saved information should include: first name, last name, phone number, and email address.

The client should not be required to enter these details again every time they make a new booking.

After logging in, the booking flow should allow the client to select a procedure, select a specialist if several specialists provide that procedure, select an available date and time, and confirm the booking.

The goal is to make repeat bookings as fast and convenient as possible, without repeatedly completing personal information fields.

5. Client Consultation Form at First Registration

During the client's **first registration** on the website, the client must complete a mandatory consultation/profile form.

The form should be completed once and saved in the client's personal account. It should not need to be completed again for every future booking.

The form should include: first name and last name; date of birth; phone number; email address; allergies and details of any known allergic reactions; important health information relevant to cosmetic, aesthetic, injectable, or device-based procedures; relevant contraindications or other important information; consent to the procedure; and confirmation that the client has read the required information and provided accurate information.

The completed form must be stored in the client's profile and be accessible to authorized clinic staff before the procedure.

The client should be able to update relevant information later, for example if a new allergy appears or other important information changes.

The administration panel should allow authorized administrators to **add, remove, or edit questions in the consultation form without changing the website code.**

Key System Requirement

The booking system must dynamically calculate availability separately for each staff member based on:

staff working schedule + services assigned to that staff member + duration of the selected procedure + existing bookings + mandatory 15-minute buffer after each procedure.

Clients must see **only time slots that are genuinely available for booking.** All client information, including contact details and the completed consultation form, must be linked to the client's personal account so that saved information can be used automatically for future bookings.
